Over recent years there has been a tremendous upsurge in interest in the fracture behaviour of polymers. One reason for this is the increasing use of polymers in structural engineering applications, since in such circumstances it is essential to have as complete an understanding as possible of the polymer's fracture behaviour.

The fracture behaviour of hybrid-particulate composites has been examined. These novel materials contain both dispersed rubbery and rigid glass particles, and values of the stress-intensity factor  $K_{Ic}$  and fracture energy  $G_{Ic}$  have been determined using a double-torsion test.

A fracture could also be simply described by a vertical well with wellbore storage and skin. Although the fracture behaviour may not be well modelled, the match during the radial flow regime will result in a total equivalent skin. In a fractured well, the skin will be negative up to -7.
